

## 1.4-W MONO FILTER-FREE CLASS-D AUDIO POWER AMPLIFIER

### FEATURES

- Qualification in Accordance With AEC-Q100 <sup>(1)</sup>
- Qualified for Automotive Applications
- Customer-Specific Configuration Control Can Be Supported Along With Major-Change Approval
- 1.4 W Into 8 Ω From a 5-V Supply at THD = 10% (Typ)
- Maximum Battery Life and Minimum Heat
  - Efficiency With an 8-Ω Speaker:
    - 84% at 400 mW
    - 79% at 100 mW
  - 2.8-mA Quiescent Current
  - 0.5-μA Shutdown Current
- Only Three External Components
  - Optimized PWM Output Stage Eliminates LC Output Filter
  - Internally Generated 250-kHz Switching Frequency Eliminates Capacitor and Resistor
  - Improved PSRR (-71 dB at 217 Hz) and Wide Supply Voltage (2.5 V to 5.5 V) Eliminates Need for a Voltage Regulator
  - Fully Differential Design Reduces RF Rectification and Eliminates Bypass Capacitor
  - Improved CMRR Eliminates Two Input Coupling Capacitors

### Space Saving Package

- 3 mm x 3 mm QFN package (DRB)
- 2,5 mm x 2,5 mm MicroStar Junior™ BGA Package (ZQY)
- 3 mm x 5 mm MSOP PowerPAD™ Package (DGN)
- TPA2010D1 Available in 1,45 mm x 1,45 mm WCSP (YZF)

### APPLICATIONS

- Ideal for Wireless or Cellular Handsets and PDAs

### DESCRIPTION

The TPA2005D1 is a 1.4-W high-efficiency filter-free class-D audio power amplifier in a MicroStar Junior™ BGA, QFN, or MSOP package that requires only three external components.

Features like 84% efficiency, -71-dB PSRR at 217 Hz, improved RF-rectification immunity, and 15-mm<sup>2</sup> total PCB area make the TPA2005D1 ideal for cellular handsets. A fast start-up time of 9 ms with minimal pop makes the TPA2005D1 ideal for PDA applications.

In cellular handsets, the earpiece, speaker phone, and melody ringer can each be driven by the TPA2005D1. The device allows independent gain control by summing the signals from each function, while minimizing noise to only 48 μV<sub>RMS</sub>.

(1) Contact factory for details. Q100 qualification data available on request.

### APPLICATION CIRCUIT

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

MicroStar Junior, PowerPAD are trademarks of Texas Instruments.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### ORDERING INFORMATION

T <sub>A</sub>	PACKAGE	PART NUMBER	SYMBOL
-40°C to 85°C	MicroStar Junior™ (GQY)	TPA2005D1GQYR <sup>(1)</sup>	PREVIEW
	MicroStar Junior™ (ZQY) <sup>(2)</sup>	TPA2005D1ZQYR <sup>(1)</sup>	PREVIEW
	8-pin QFN (DRB)	TPA2005D1DRBR <sup>(1)</sup>	BIQ
	8-pin MSOP (DGN)	TPA2005D1DGN(R)	PREVIEW

- (1) The GQY, ZQY, and DRB packages are only available taped and reeled. An R at the end of the part number indicates the devices are taped and reeled.  
 (2) The GQY is the standard MicroStar Junior™ package. The ZQY is lead-free option, and is qualified for 260° lead-free assembly.

### ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted<sup>(1)</sup>

		UNIT
V <sub>DD</sub>	Supply voltage <sup>(2)</sup>	
	In active mode	-0.3 V to 6 V
	In <b>SHUTDOWN</b> mode	-0.3 V to 7 V
V <sub>I</sub>	Input voltage	-0.3 V to V <sub>DD</sub> + 0.3 V
	Continuous total power dissipation	See Dissipation Rating Table
T <sub>A</sub>	Operating free-air temperature	-40°C to 85°C
T <sub>J</sub>	Operating junction temperature	-40°C to 150°C
T <sub>stg</sub>	Storage temperature	-65°C to 85°C
	Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.  
 (2) For the MSOP (DGN) package option, the maximum V<sub>DD</sub> should be limited to 5 V if short-circuit protection is desired.

### RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
V <sub>DD</sub>	Supply voltage	2.5		5.5	V
V <sub>IH</sub>	High-level input voltage	<b>SHUTDOWN</b>		V <sub>DD</sub>	V

**PIN ASSIGNMENTS**

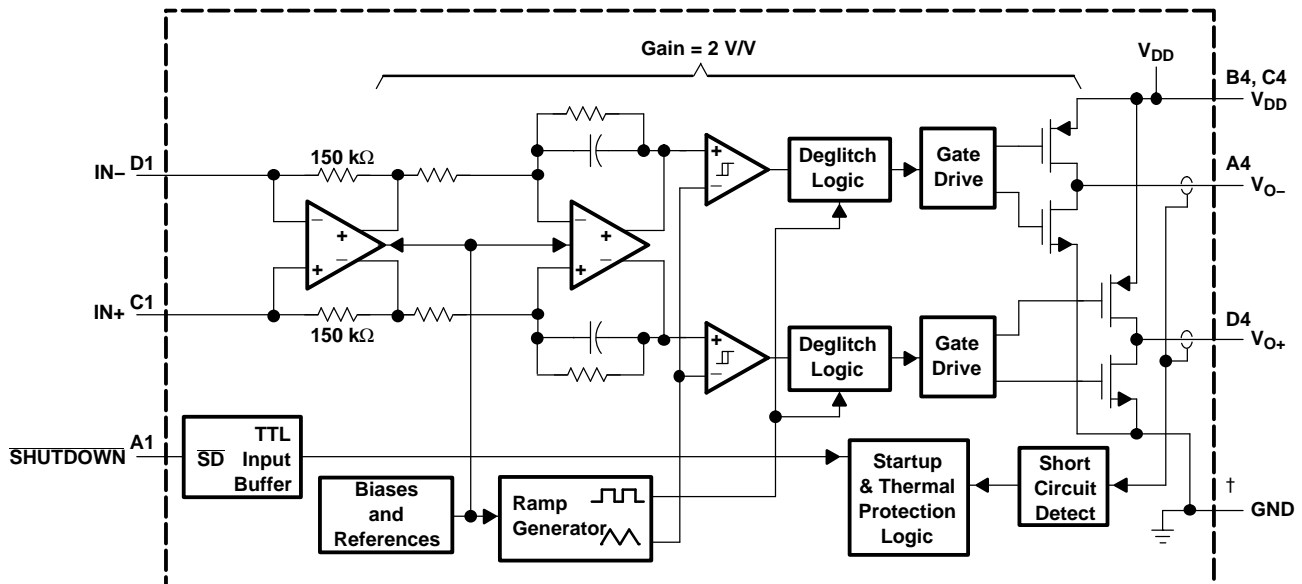

NC – No internal connection

- A. The shaded terminals are used for electrical and thermal connections to the ground plane. All of the shaded terminals must be electrically connected to ground. No connect (NC) terminals still need a pad and trace.
- B. The thermal pad of the DRB and DGN packages must be electrically and thermally connected to a ground plane.

**Terminal Functions**

TERMINAL		I/O	DESCRIPTION
NAME	ZQY, GQY		
IN-	D1	4	I Negative differential input
IN+	C1	3	I Positive differential input
V <sub>DD</sub>	B4, C4	6	I Power supply
V <sub>O+</sub>	D4	5	O Positive BTL output
GND	A2, A3, B3, C2, C3, D2, D3	7	I High-current ground
V <sub>O-</sub>	A4	8	O Negative BTL output
SHUTDOWN	A1	1	I Shutdown terminal (active low logic)
NC	B1	2	No internal connection
Thermal Pad			Must be soldered to a grounded pad on the PCB.

### TEST SET-UP FOR GRAPHS

- $C_1$  was shorted for any common-mode input voltage measurement.
- A  $33\text{-}\mu\text{H}$  inductor was placed in series with the load resistor to emulate a small speaker for efficiency measurements.
- The 30-kHz low-pass filter is required, even if the analyzer has a low-pass filter. An RC filter ( $100\ \Omega$ ,  $47\ \text{nF}$ ) is used on each output for the data sheet graphs.

## APPLICATION INFORMATION

### FULLY DIFFERENTIAL AMPLIFIER

The TPA2005D1 is a fully differential amplifier with differential inputs and outputs. The fully differential amplifier consists of a differential amplifier and a common-mode amplifier. The differential amplifier ensures that the amplifier outputs a differential voltage on the output that is equal to the differential input times the gain. The common-mode feedback ensures that the common-mode voltage at the output is biased around  $V_{DD}/2$ , regardless of the common-mode voltage at the input. The fully differential TPA2005D1 can still be used with a single-ended input; however, the TPA2005D1 should be used with differential inputs when in a noisy environment, like a wireless handset, to ensure maximum noise rejection.

#### Advantages of Fully Differential Amplifiers

- Input-coupling capacitors not required:
  - The fully differential amplifier allows the inputs to be biased at a voltage other than midsupply. For example, if a codec has a midsupply lower than the midsupply of the TPA2005D1, the common-mode feedback circuit adjusts, and the TPA2005D1 outputs still is biased at midsupply of the TPA2005D1. The inputs of the TPA2005D1 can be biased from 0.5 V to  $V_{DD} - 0.8$  V. If the inputs are biased outside of that range, input-coupling capacitors are required.
- Midsupply bypass capacitor,  $C_{(BYPASS)}$ , not required:
  - The fully differential amplifier does not require a bypass capacitor. This is because any shift in the midsupply affects both positive and negative channels equally and cancels at the differential output.
- Better RF-immunity:
  - GSM handsets save power by turning on and shutting off the RF transmitter at a rate of 217 Hz. The transmitted signal is picked-up on input and output traces. The fully differential amplifier cancels the signal much better than the typical audio amplifier.

### COMPONENT SELECTION

Figure 26 shows the TPA2005D1 typical schematic with differential inputs, and Figure 27 shows the TPA2005D1 with differential inputs and input capacitors, and Figure 28 shows the TPA2005D1 with single-ended inputs. Differential inputs should be used whenever possible, because the single-ended inputs are much more susceptible to noise.

Table 1. Typical Component Values

REF DES	VALUE	EIA SIZE	MANUFACTURER	PART NUMBER
$R_I$	150 k $\Omega$ ( $\pm 0.5\%$ )	0402	Panasonic	ERJ2RHD154V
$C_S$	1 $\mu$ F (+22%, -80%)	0402	Murata	GRP155F50J105Z
$C_I^{(1)}$	3.3 nF ( $\pm 10\%$ )	0201	Murata	GRP033B10J332K

(1)  $C_I$  is needed only for single-ended input or if  $V_{ICM}$  is not between 0.5 V and  $V_{DD} - 0.8$  V.  $C_I = 3.3$  nF (with  $R_I = 150$  k $\Omega$ ) gives a high-pass corner frequency of 321 Hz.

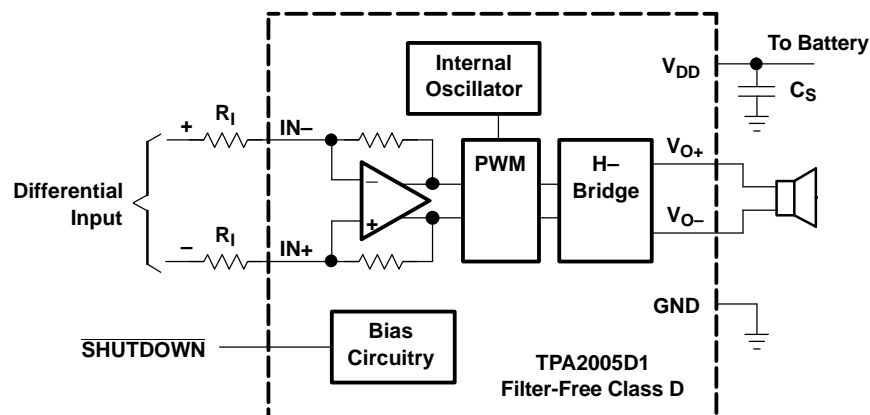

Figure 26. Typical TPA2005D1 Application Schematic With Differential Input for a Wireless Phone

Figure 27. TPA2005D1 Application Schematic With Differential Input and Input Capacitors

Figure 28. TPA2005D1 Application Schematic With Single-Ended Input

### Input Resistors ( $R_I$ )

The input resistors ( $R_I$ ) set the gain of the amplifier according to equation [Equation 1](#).

$$\text{Gain} = 2 \times \frac{150 \text{ k}\Omega}{R_I} \quad (1)$$

**Resistor matching is very important in fully differential amplifiers.** The balance of the output on the reference voltage depends on matched ratios of the resistors. CMRR, PSRR, and cancellation of the second harmonic distortion diminish if resistor mismatch occurs. Therefore, it is recommended to use 1% tolerance resistors, or better, to keep the performance optimized. Matching is more important than overall tolerance. Resistor arrays with 1% matching can be used with a tolerance greater than 1%.

Place the input resistors very close to the TPA2005D1 to limit noise injection on the high-impedance nodes.

For optimal performance, the gain should be set to 2 V/V or lower. Lower gain allows the TPA2005D1 to operate at its best and keeps a high voltage at the input, making the inputs less susceptible to noise.

### Decoupling Capacitor ( $C_S$ )

The TPA2005D1 is a high-performance class-D audio amplifier that requires adequate power-supply decoupling to ensure the efficiency is high and total harmonic distortion (THD) is low. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically 1  $\mu\text{F}$ , placed as close as possible to the device  $V_{DD}$  lead, works best. Placing this decoupling capacitor close to the TPA2005D1 is very important for the efficiency of the class-D amplifier, because any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency. For filtering lower-frequency noise signals, a 10- $\mu\text{F}$ , or greater, capacitor placed near the audio power amplifier also helps, but it is not required in most applications because of the high PSRR of this device.

### Input Capacitors ( $C_I$ )

The TPA2005D1 does not require input coupling capacitors if the design uses a differential source that is biased from 0.5 V to  $V_{DD} - 0.8$  V (shown in [Figure 26](#)). If the input signal is not biased within the recommended common-mode input range, if needing to use the input as a high pass filter (shown in [Figure 27](#)), or if using a single-ended source (shown in [Figure 28](#)), input coupling capacitors are required.

The input capacitors and input resistors form a high-pass filter with the corner frequency,  $f_c$ , determined in [Equation 2](#).

$$f_c = \frac{1}{(2\pi R_I C_I)} \quad (2)$$

The value of the input capacitor is important to consider, as it directly affects the bass (low frequency) performance of the circuit. Speakers in wireless phones usually cannot respond well to low frequencies, so the corner frequency can be set to block low frequencies in this application.

[Equation 3](#) is reconfigured to solve for the input coupling capacitance.

$$C_I = \frac{1}{(2\pi R_I f_c)} \quad (3)$$

If the corner frequency is within the audio band, the capacitors should have a tolerance of  $\pm 10\%$  or better, because any mismatch in capacitance causes an impedance mismatch at the corner frequency and below.

For a flat low-frequency response, use large input coupling capacitors (1  $\mu\text{F}$ ). However, in a GSM phone the ground signal is fluctuating at 217 Hz, but the signal from the codec does not have the same 217-Hz fluctuation. The difference between the two signals is amplified, sent to the speaker, and heard as a 217-Hz hum.

### SUMMING INPUT SIGNALS WITH THE TPA2005D1

Most wireless phones or PDAs need to sum signals at the audio power amplifier or just have two signal sources that need separate gain. The TPA2005D1 makes it easy to sum signals or use separate signal sources with different gains. Many phones now use the same speaker for the earpiece and ringer, where the wireless phone would require a much lower gain for the phone earpiece than for the ringer. PDAs and phones that have stereo headphones require summing of the right and left channels to output the stereo signal to the mono speaker.

### Summing Two Differential Input Signals

Two extra resistors are needed for summing differential signals (a total of 5 components). The gain for each input source can be set independently (see Equation 4 and Equation 5 and Figure 29).

$$\text{Gain 1} = \frac{V_O}{V_{I1}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I1}} \quad \left(\frac{V}{V}\right) \tag{4}$$

$$\text{Gain 2} = \frac{V_O}{V_{I2}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I2}} \quad \left(\frac{V}{V}\right) \tag{5}$$

If summing left and right inputs with a gain of 1 V/V, use  $R_{I1} = R_{I2} = 300 \text{ k}\Omega$ .

If summing a ring tone and a phone signal, set the ring-tone gain to gain 2 = 2 V/V, and the phone gain to gain 1 = 0.1 V/V. The resistor values are:

- $R_{I1} = 3 \text{ M}\Omega$  and  $R_{I2} = 150 \text{ k}\Omega$ .

Figure 29. Application Schematic With TPA2005D1 Summing Two Differential Inputs

### Summing a Differential Input Signal and a Single-Ended Input Signal

Figure 30 shows how to sum a differential input signal and a single-ended input signal. Ground noise can couple in through IN+ with this method. It is better to use differential inputs. The corner frequency of the single-ended input is set by  $C_{I2}$ , shown in Equation 8. To ensure that each input is balanced, the single-ended input must be driven by a low-impedance source even if the input is not in use.

$$\text{Gain 1} = \frac{V_O}{V_{I1}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I1}} \quad \left(\frac{V}{V}\right) \tag{6}$$

$$\text{Gain 2} = \frac{V_O}{V_{I2}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I2}} \quad \left(\frac{V}{V}\right) \tag{7}$$

$$C_{I2} = \frac{1}{(2\pi R_{I2} f_{c2})} \tag{8}$$

If summing a ring tone and a phone signal, the phone signal should use a differential input signal while the ring tone might be limited to a single-ended signal. If phone gain is set at gain 1 = 0.1 V/V, and the ring-tone gain is set to gain 2 = 2 V/V, the resistor values are:

- $R_{11} = 3 \text{ M}\Omega$  and  $R_{12} = 150 \text{ k}\Omega$ .

The high-pass corner frequency of the single-ended input is set by  $C_{12}$ . If the desired corner frequency is less than 20 Hz, then:

$$C_{12} > \frac{1}{(2\pi \cdot 150\text{k}\Omega \cdot 20\text{Hz})} \quad (9)$$

$$C_{12} > 53\text{pF} \quad (10)$$

Figure 30. Application Schematic With TPA2005D1 Summing Differential Input and Single-Ended Input Signals

### Summing Two Single-Ended Input Signals

Four resistors and three capacitors are needed for summing single-ended input signals. The gain and corner frequencies ( $f_{c1}$  and  $f_{c2}$ ) for each input source can be set independently (see [Equation 11](#) through [Equation 14](#) and [Figure 31](#)). Resistor,  $R_p$ , and capacitor,  $C_p$ , are needed on the IN+ terminal to match the impedance on the IN- terminal. The single-ended inputs must be driven by low-impedance sources, even if one of the inputs is not outputting an ac signal.

$$\text{Gain 1} = \frac{V_O}{V_{I1}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I1}} \quad \left(\frac{\text{V}}{\text{V}}\right) \quad (11)$$

$$\text{Gain 2} = \frac{V_O}{V_{I2}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I2}} \quad \left(\frac{\text{V}}{\text{V}}\right) \quad (12)$$

$$C_{I1} = \frac{1}{(2\pi R_{I1} f_{c1})} \quad (13)$$

$$C_{I2} = \frac{1}{(2\pi R_{I2} f_{c2})} \quad (14)$$

$$C_P = C_{I1} + C_{I2} \quad (15)$$

$$R_P = \frac{R_{I1} \times R_{I2}}{(R_{I1} + R_{I2})} \quad (16)$$

Figure 31. Application Schematic With TPA2005D1 Summing Two Single-Ended Inputs

## EFFICIENCY AND THERMAL INFORMATION

The maximum ambient temperature depends on the heat-sinking ability of the PCB system. The derating factor for the 2,5-mm x 2,5-mm MicroStar Junior package is shown in the dissipation rating table. Converting this to  $\theta_{JA}$ :

$$\theta_{JA} = \frac{1}{\text{Derating Factor}} = \frac{1}{0.016} = 62.5^\circ\text{C/W} \quad (17)$$

Given  $\theta_{JA}$  of  $62.5^\circ\text{C/W}$ , the maximum allowable junction temperature of  $150^\circ\text{C}$ , and the maximum internal dissipation of 0.2 W (worst case 5-V supply), the maximum ambient temperature can be calculated with equation Equation 18.

$$T_{A \text{ Max}} = T_{J \text{ Max}} - \theta_{JA} P_{D \text{ max}} = 150 - 62.5 (0.2) = 137.5^\circ\text{C} \quad (18)$$

Equation 18 shows that the calculated maximum ambient temperature is  $137.5^\circ\text{C}$  at maximum power dissipation with a 5-V supply; however, the maximum ambient temperature of the package is limited to  $85^\circ\text{C}$ . Because of the efficiency of the TPA2005D1, it can be operated under all conditions to an ambient temperature of  $85^\circ\text{C}$ . The TPA2005D1 is designed with thermal protection that turns the device off when the junction temperature surpasses  $150^\circ\text{C}$  to prevent damage to the IC. Also, using speakers more resistive than  $8 \Omega$  dramatically increases the thermal performance by reducing the output current and increasing the efficiency of the amplifier.

## BOARD LAYOUT

### Component Location

Place all the external components very close to the TPA2005D1. The input resistors need to be very close to the TPA2005D1 input pins so noise does not couple on the high-impedance nodes between the input resistors and the input amplifier of the TPA2005D1. Placing the decoupling capacitor,  $C_S$ , close to the TPA2005D1 is important for the efficiency of the class-D amplifier. Any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency.

### Trace Width

Make the high current traces going to pins VDD, GND,  $V_{O+}$  and  $V_{O-}$  of the TPA2005D1 have a minimum width of 0,7 mm. If these traces are too thin, the TPA2005D1 performance and output power will decrease. The input traces do not need to be wide, but do need to run side-by-side to enable common-mode noise cancellation.

### MicroStar Junior™ BGA Layout

Use the following MicroStar Junior BGA ball diameters:

- 0,25 mm diameter solder mask
- 0,28 mm diameter solder paste mask/stencil
- 0,38 mm diameter copper trace

Figure 32 shows how to lay out a board for the TPA2005D1 MicroStar Junior BGA.

Figure 32. TPA2005D1 MicroStar Junior BGA Board Layout (Top View)

### 8-Pin QFN (DRB) Layout

Use the following land pattern for board layout with the 8-pin QFN (DRB) package. Note that the solder paste should use a hatch pattern to fill solder paste at 50% to ensure that there is not too much solder paste under the package.

Figure 33. TPA2005D1 8-Pin QFN (DRB) Board Layout (Top View)

## ELIMINATING THE OUTPUT FILTER WITH THE TPA2005D1

This section focuses on why the user can eliminate the output filter with the TPA2005D1.

### Effect on Audio

The class-D amplifier outputs a pulse-width modulated (PWM) square wave, which is the sum of the switching waveform and the amplified input audio signal. The human ear acts as a band-pass filter such that only the frequencies between approximately 20 Hz and 20 kHz are passed. The switching frequency components are much greater than 20 kHz, so the only signal heard is the amplified input audio signal.

### Traditional Class-D Modulation Scheme

The traditional class-D modulation scheme, which is used in the TPA005Dxx family, has a differential output in which each output is 180 degrees out of phase and changes from ground to the supply voltage,  $V_{DD}$ . Therefore, the differential pre-filtered output varies between positive and negative  $V_{DD}$ , where filtered 50% duty cycle yields 0 V across the load. The traditional class-D modulation scheme with voltage and current waveforms is shown in [Figure 34](#). Note that, even at an average of 0 V across the load (50% duty cycle), the current to the load is high, causing a high loss and thus causing a high supply current.

Figure 34. Traditional Class-D Modulation Scheme Output Voltage and Current Waveforms Into an Inductive Load With No Input

### TPA2005D1 Modulation Scheme

The TPA2005D1 uses a modulation scheme that still has each output switching from 0 to the supply voltage. However, OUT+ and OUT- are now in phase with each other, with no input. The duty cycle of OUT+ is greater than 50% and OUT- is less than 50% for positive voltages. The duty cycle of OUT+ is less than 50% and OUT- is greater than 50% for negative voltages. The voltage across the load remains at 0 V throughout most of the switching period, greatly reducing the switching current, which reduces any  $I^2R$  losses in the load.

Figure 35. The TPA2005D1 Output Voltage and Current Waveforms Into an Inductive Load

### Efficiency: Why You Must Use a Filter With the Traditional Class-D Modulation Scheme

The main reason that the traditional class-D amplifier needs an output filter is that the switching waveform results in maximum current flow. This causes more loss in the load, which causes lower efficiency. The ripple current is large for the traditional modulation scheme because the ripple current is proportional to voltage multiplied by the time at that voltage. The differential voltage swing is  $2 \times V_{DD}$ , and the time at each voltage is one-half the period for the traditional modulation scheme. An ideal LC filter is needed to store the ripple current from each half-cycle for the next half-cycle, while any resistance causes power dissipation. The speaker is both resistive and reactive, whereas an LC filter is almost purely reactive.

The TPA2005D1 modulation scheme has very little loss in the load without a filter because the pulses are very short and the change in voltage is  $V_{DD}$  instead of  $2 \times V_{DD}$ . As the output power increases, the pulses widen, making the ripple current larger. Ripple current could be filtered with an LC filter for increased efficiency, but for most applications the filter is not needed.

An LC filter with a cutoff frequency less than the class-D switching frequency allows the switching current to flow through the filter instead of the load. The filter has less resistance than the speaker, resulting in less power dissipation, which increases efficiency.

### Effects of Applying a Square Wave Into a Speaker

If the amplitude of a square wave is high enough and the frequency of the square wave is within the bandwidth of the speaker, a square wave could cause the voice coil to jump out of the air gap and/or scar the voice coil. A 250-kHz switching frequency, however, is not significant because the speaker cone movement is proportional to  $1/f^2$  for frequencies beyond the audio band. Therefore, the amount of cone movement at the switching frequency is very small. However, damage could occur to the speaker if the voice coil is not designed to handle the additional power. To size the speaker for added power, the ripple current dissipated in the load must be calculated by subtracting the theoretical supplied power,  $P_{SUP\ THEORETICAL}$ , from the actual supply power,  $P_{SUP}$ , at maximum output power,  $P_{OUT}$ . The switching power dissipated in the speaker is the inverse of the measured efficiency,  $\eta_{MEASURED}$ , minus the theoretical efficiency,  $\eta_{THEORETICAL}$ .

$$P_{SPKR} = P_{SUP} - P_{SUP\ THEORETICAL} \quad (\text{at max output power}) \quad (19)$$

$$P_{SPKR} = \frac{P_{SUP}}{P_{OUT}} - \frac{P_{SUP\ THEORETICAL}}{P_{OUT}} \quad (\text{at max output power}) \quad (20)$$

$$P_{SPKR} = P_{OUT} \left( \frac{1}{\eta_{MEASURED}} - \frac{1}{\eta_{THEORETICAL}} \right) \quad (\text{at max output power}) \quad (21)$$

$$\eta_{THEORETICAL} = \frac{R_L}{R_L + 2r_{DS(on)}} \quad (\text{at max output power}) \quad (22)$$

The maximum efficiency of the TPA2005D1 with a 3.6-V supply and an 8- $\Omega$  load is 86% from [Equation 22](#). Using [Equation 21](#) with the efficiency at maximum power (84%), we see that there is an additional 17 mW dissipated in the speaker. The added power dissipated in the speaker is not an issue as long as it is taken into account when choosing the speaker.

### When to Use an Output Filter

Design the TPA2005D1 without an output filter if the traces from amplifier to speaker are short. The TPA2005D1 passed FCC and CE radiated emissions with no shielding and with speaker trace wires 100 mm long or less. Wireless handsets and PDAs are great applications for class-D without a filter.

A ferrite bead filter often can be used if the design is failing radiated emissions without an LC filter, and the frequency-sensitive circuit is greater than 1 MHz. This is good for circuits that just have to pass FCC and CE because FCC and CE only test radiated emissions greater than 30 MHz. If choosing a ferrite bead, choose one with high impedance at high frequencies, but very low impedance at low frequencies.

Use an LC output filter if there are low-frequency (< 1 MHz) EMI-sensitive circuits and/or there are long leads from amplifier to speaker.

[Figure 36](#) and [Figure 37](#) show typical ferrite bead and LC output filters.

Figure 36. Typical Ferrite Chip Bead Filter (Chip bead example: NEC/Tokin: N2012ZPS121)

**PACKAGING INFORMATION**

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins	Package Qty	Eco Plan <sup>(2)</sup>	Lead/Ball Finish	MSL Peak Temp <sup>(3)</sup>
TPA2005D1DRBQ1	ACTIVE	SON	DRB	8	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PLASTIC SMALL OUTLINE

4203482/G 11/04

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Small Outline No-Lead (SON) package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
  - Metalized features are supplier options and may not be on the package.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
